

Quarterly Layout Analysis Report

1. Introduction

Docling parses documents into a unified structured representation with rich layout provenance. Each element carries a bounding box on its page, enabling downstream tools to overlay, crop, and cross reference detected content across the rendered raster images produced by the conversion pipeline.

Docling parses documents into a unified structured representation with rich layout provenance. Each element carries a bounding box on its page, enabling downstream tools to overlay, crop, and cross reference detected content across the rendered raster images produced by the conversion pipeline.

1.1 Key Points

- Provenance boxes are stored per element.
- Page images render at a configurable scale.
- Coordinates must be mapped into pixel space.

2. Tabular Results

Docling parses documents into a unified structured representation with rich layout provenance. Each element carries a bounding box on its page, enabling downstream tools to overlay, crop, and cross reference detected content across the rendered raster images produced by the conversion pipeline.

Region	Documents	Tables	Figures
North	1204	312	88
South	980	205	64
East	1560	410	133
West	742	150	51

Table 1. Aggregated processing counts per region.

Docling parses documents into a unified structured representation with rich layout provenance. Each element carries a bounding box on its page, enabling downstream tools to overlay, crop, and cross reference detected content across the rendered raster images produced by the conversion pipeline.

3. Figures

Docling parses documents into a unified structured representation with rich layout provenance. Each element carries a bounding box on its page, enabling downstream tools to overlay, crop, and cross reference detected content across the rendered raster images produced by the conversion pipeline.

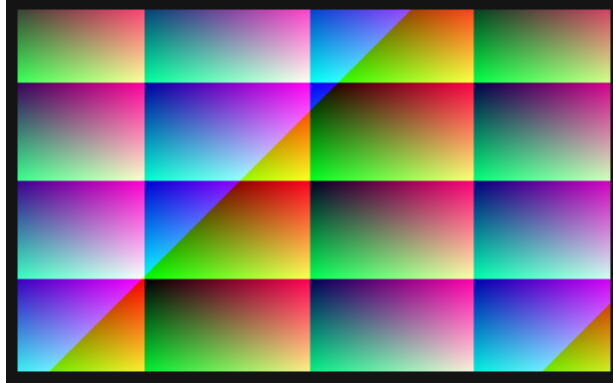

Figure 1. Synthetic raster used for layout detection.

3.1 Discussion

Docling parses documents into a unified structured representation with rich layout provenance. Each element carries a bounding box on its page, enabling downstream tools to overlay, crop, and cross reference detected content across the rendered raster images produced by the conversion pipeline.

Docling parses documents into a unified structured representation with rich layout provenance. Each element carries a bounding box on its page, enabling downstream tools to overlay, crop, and cross reference detected content across the rendered raster images produced by the conversion pipeline.
